| Sara Dickinson | <a href="mailto:sara@sinodun.com">sara@sinodun.com</a> (Presenter) |
| John Dickinson | <a href="mailto:jad@sinodun.com">jad@sinodun.com</a>               |
| Jim Hague      | <a href="mailto:jim@sinodun.com">jim@sinodun.com</a>               |

# Agenda

- Two topics
  - Summary of initial benchmarking work on TCP/TLS for recursive resolvers
  - (Time permitting) Brief look at level of implementation & deployment of both DNS over TLS & HTTP

# Benchmarking

Partly funded by a grant from the Open Technology Fund  
(and NLnet Foundation)

- GOALS of this initial work:
  - **Understand characteristics** of how existing recursive servers handle TCP and TLS loads
  - **Looking at relative performance** cf. UDP more than absolute at this stage

# Benchmarking

Partly funded by a grant from the Open Technology Fund  
(and NLnet Foundation)

- GOALS of this initial work:
  - **Understand characteristics** of how existing recursive servers handle TCP and TLS loads
  - **Looking at relative performance** cf. UDP more than absolute at this stage

**Much more complex than UDP...**  
**Many more parameters...**

# Nameservers tested

- **Bind 9.12.1 (No TLS)**
- **Unbound 1.7.0**
- **Knot Resolver 2.3.0**
- **dnscrypt 1.3.0**

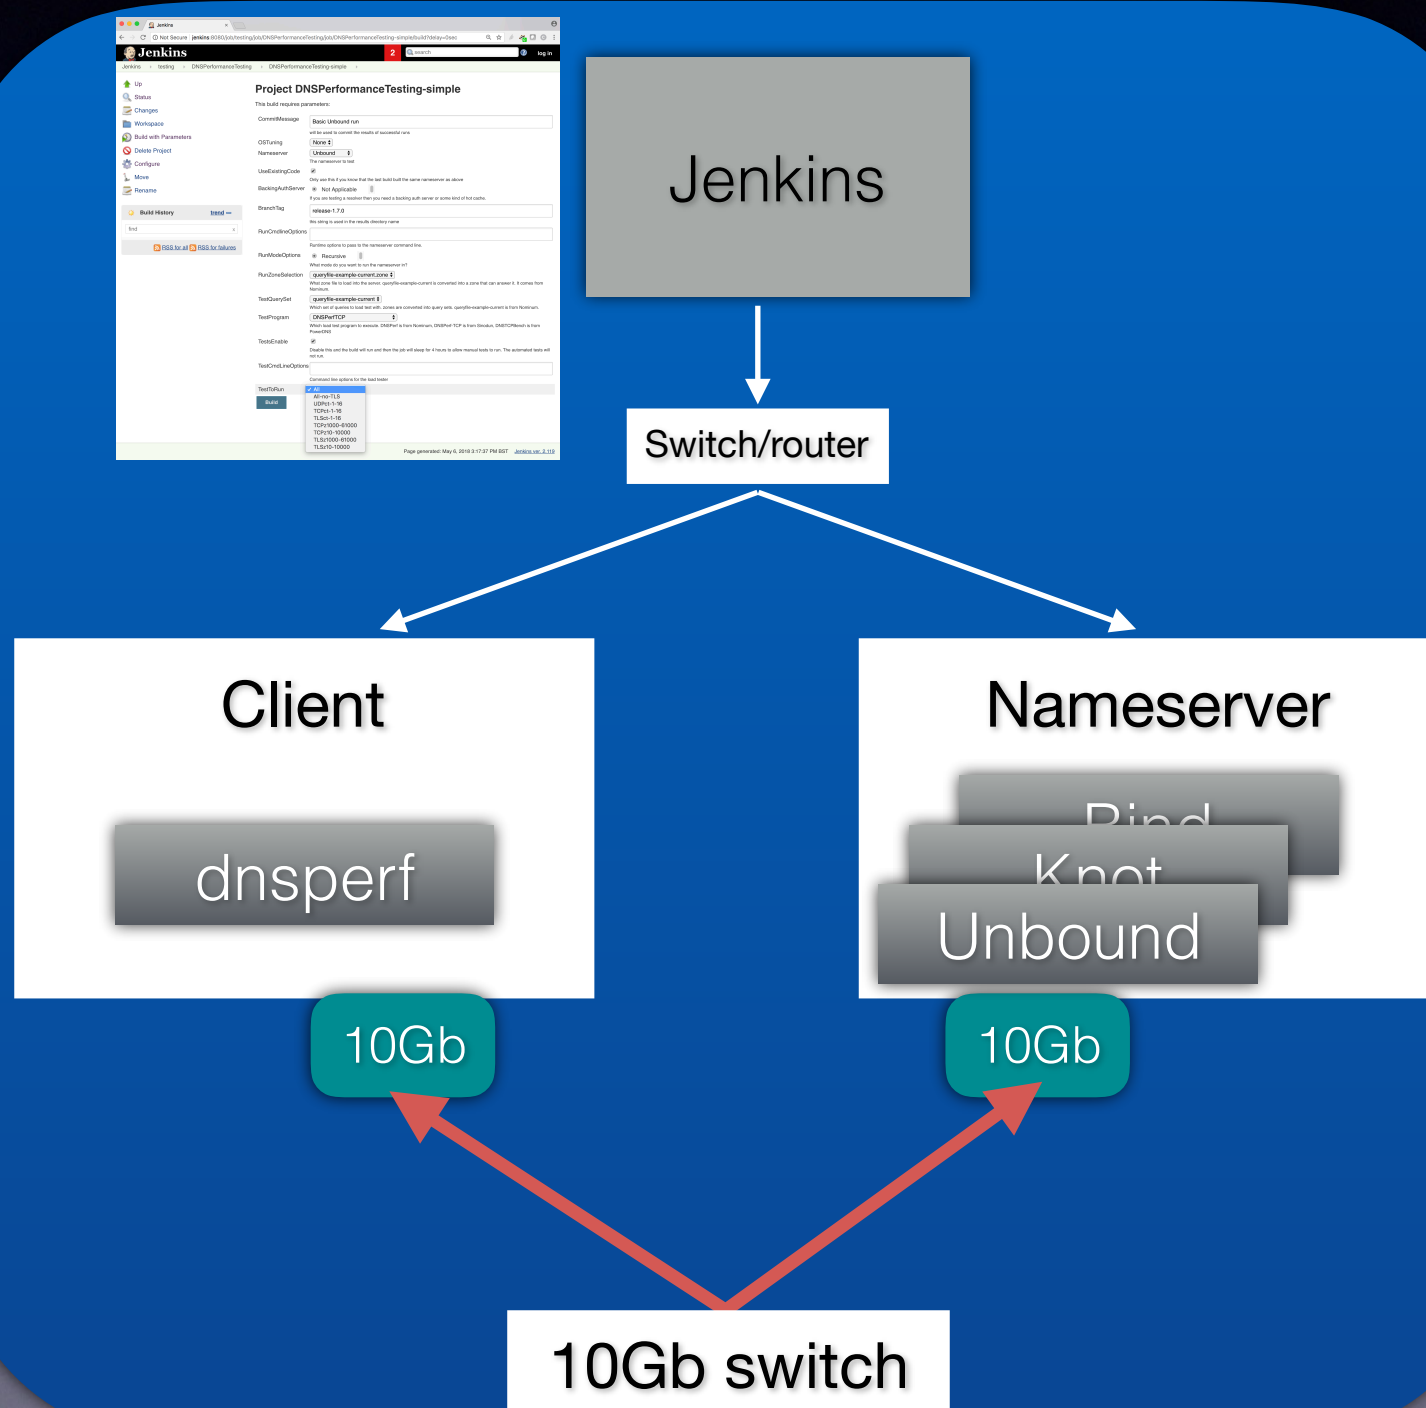

Other nameservers are available....

# Test setup - Hardware

‘Out of the box’  
testing

- 2\*8 core Intel Xenon @ 2.1Ghz, 32Gb RAM
- Ubuntu 18.04
- Only basic OS and NS tuning
- NS locked to 4 cores (threads)
- Hot cache

# Test setup - Software

**GitHub:**  
[sinodun/dnsperf-tcp](https://github.com/sinodun/dnsperf-tcp)

- **dnsperf**: from Nominum/Akamai (not resperf)
- **dnsperf-tcp**: fork of dnsperf with tcp support
- **dnsperf-tls**: branch with tls support but..
  - implementation issues due to threading

# Test setup - Software

**GitHub:**  
[sinodun/dnsperf-tcp](https://github.com/sinodun/dnsperf-tcp)

- **dnsperf**: from Nominum/Akamai (not resperf)
- **dnsperf-tcp**: fork of dnsperf with tcp support
- **dnsperf-tls**: branch with tls support but..
  - implementation issues due to threading

TLS 1.2,  
No TFO, TLS SR,...

# Test setup - Software

[sinodun/dnsperf-tcp](https://github.com/sinodun/dnsperf-tcp)

- **dnsperf**: from Nominum/Akamai (not resperf)
- **dnsperf-tcp**: fork of dnsperf with tcp support
- **dnsperf-tls**: branch with tls support but..
  - implementation issues due to threading

TLS 1.2,  
No TFO, TLS SR,...

Focus on few clients,  
Varying q per conn

- Increasing load by adding clients

# UDP

- Unbound & dnssdist similar
- Bind very flat

- Increasing load by adding clients
- 20,000 q per conn

# UDP vs TCP

- dnssdist TCP better than UPD (but threading is diff)!
- Others similar reduction

- 8 clients
- 20,000 q per conn

# % of UDP

- dnssdist best
- Unbound does not do concurrent processing

- Using 8 clients
- Solid line is TCP, dotted is TLS

# Low q/conn

- dnssdist fall-off ~2000
- U & B fall-off ~1000
- Knot TCP is very flat

- Using 8 clients
- Solid line is TCP, dotted is TLS

# Low q/conn

- dnssdist fall-off ~2000
- U & B fall-off ~1000
- Knot TCP is very flat

- Using 8 clients
- Solid line is TCP, dotted is TLS

# Low q/conn

- dnssdist fall-off ~2000
- U & B fall-off ~1000
- Knot TCP is very flat

- Using 8 clients
- Current test system hits issues...

# Low q/conn

- Knot flat till ~100 q/conn
- Others linear decline
- $(1 + N)/N$  dips ~ 100

- Using 8 clients
- Current test system hits issues...

# Low q/conn

- Knot flat till  $\sim 100$  q/conn
- Others linear decline
- $(1 + N)/N$  dips  $\sim 100$

# TODO list

- Understand implementations better
- OS + NS tuning
- Drill to lower q/conn for TCP and TLS
  - Add tricks: TFO, TLS Session Resumption, TLS 1.3,...
- Scale to MANY clients
- Compare to TLS proxy e.g. nginx, haproxy
- Add concurrent processing to Unbound
- Use new/different test tool?

# Deployment & Implementation

DOT: DNS-over-TLS

DOH: DNS-over-HTTPS (WIP)

# Implementation

|             | Client   | Recursive Resolver   |
|-------------|--|--|
| <b>DOT</b>  | <ul style="list-style-type: none"><li>• Stubby</li><li>• Unbound/Knot resolver (fwd)</li><li>• Android system (dev)</li><li>• systemd (<u>PR</u>)</li></ul>        | <ul style="list-style-type: none"><li>• Unbound, Knot Resolver, dnsmdist + CoreDNS, Tenta</li><li>• BIND on the way?</li></ul> |
| <b>DOH*</b> | <ul style="list-style-type: none"><li>• Android Intra App</li><li>• Firefox config option</li><li>• Stubby (next release)</li><li>• Various experimental</li></ul> | <ul style="list-style-type: none"><li>• Various experimental</li></ul>   |

\* 10+ implementations (see DOH mailing list and IETF 101 Hackathon)

# Recursive Resolver Deployment

|             | Standalone  | Large Scale  |
|-------------|---|--|
| <b>DOT</b>  | <ul style="list-style-type: none"><li>• <u>19 test servers</u></li></ul>  | <ul style="list-style-type: none"><li>• Quad9 (9.9.9.9)</li><li>• Cloudflare (1.1.1.1)</li></ul>   |
| <b>DOH*</b> | <ul style="list-style-type: none"><li>• Google<br/><a href="https://dns.google.com/experimental">https://dns.google.com/experimental</a></li><li>• Few other test servers</li></ul> | <ul style="list-style-type: none"><li>• Cloudflare<br/><a href="https://cloudflare-dns.com/dns-query">https://cloudflare-dns.com/dns-query</a></li></ul> |

\* Experimental, some support JSON as well as wireformat

# Stub to recursive is changing

- DOH draft is in WGLC
- Expect browsers to adopt DOH (default?), other apps?
- System components to use either DOT or DOH...?
- What does this mean for users
  - Privacy (yeah!) but...
  - Multiple config points (transport & DNSSEC), multiple recursives, monitoring?

# Stub to recursive is changing
